Contents

Description of individual high-grade steel types

1.4301:
Austenitic stainless steel. Very high cold formability. Easily weldable. High corrosion resistance. Polishable. Highly suited for vacuum applications.

1.4305:
Easy to machine. Lower corrosion resistance than 1.4301. Not weldable. Moderately suitable for vacuum applications.

1.4306, 1.4307:
Low-carbon variant of 1.4301 with similar properties. Highly weldable due to low carbon level, very insusceptible to intergranular corrosion. Highly suited for vacuum applications.

1.4401:
Very high cold formability. Easily weldable. Due to molybdenum additive, more resistant than 1.4301 to non-oxidising acids and chlorine compound, polishable, well suited for vacuum applications.

1.4404:
Significantly less carbon than 1.4401 but with similar properties. Highly weldable due to low carbon level, very insusceptible to intergranular corrosion. Highly suited for vacuum applications.

1.4429:
Similar properties to 1.4435 but higher strength due to higher nitrogen share. The nitrogen share also stabilises the austenitic structure. Highly suited for vacuum applications.

1.4435:
Similar properties to 1.4404. The increased share of molybdenum makes 1.4435 more resistant to non-oxidising acids and media containing chlorine than 1.4404. Highly suited for vacuum applications.

1.4541:
Similar properties to 1.4301 but not polishable. Titan-stabilised, which makes is highly weldable in all dimensions without being susceptible to intergranular corrosion. Well suited for vacuum applications.

1.4571:
Similar properties to 1.4401. Titan-stabilised, which makes is highly weldable in all dimensions without being susceptible to intergranular corrosion. Not polishable. Well suited for vacuum applications.

1.4429 ESR:
Very high homogeneity including purity combined with a high hardness level. Of particular importance is its very low magnetic permeability. Other properties correspond to 1.4429 although highly suitable for vacuum applications.

Aluminium components

3.1645/AlCU4PbMgMn or AlCuMgPbF38
3.1655/AlCu4BiPb 3.3214/AlMg1SiCu
Standard aluminium compositions with novotek components. They can be used for a temperature range from –196 °C to 150 °C and a pressure range of 2.5 bar to 10^{-7}mbar. They are very well suited for static loads.

Aluminium sealing materials and welded parts

3.2315/AlMgSi1
Standard aluminium composition of novotek sealing materials and welded parts. The slightly lower rigidity compared to materials for standard aluminium components makes it perfectly suitable as a sealing material. Furthermore, no permeation of gases takes place. However, these seals can only be used once.

Nickel-plated brass

2.0401/CuZn39Pb3 (MS 58)
Standard turned brass in novotek components. This material is then chem. nickel-plated. This achieves an improved corrosion resistance, hardness, toughness and ductility.

Steel (structural steel)

1.0036-38 (St37-2) 1.0570 or 1.0577 (St52-3)
Standard steel grades for novotek components. They can be welded very easily and can be stress-relieved. Furthermore, they are highly suitable for nickel or zinc coating.

Sealing materials

Elastomer seals are permeable to gas and also emit gases. The gas permeability, or permeation, depends on the material, the type of gas and ambient conditions – mainly the temperature. After an adequate evacuation time, the outward gas stream decreases considerably, which means that a relatively constant permeation gas stream materialises.

Permeation and outgassing are diffusion-dependent. High gas-proofness also means slower outgassing, which means that it takes longer until a constant permeation gas stream is created. This can take up to well over 100 hours. Heating up speeds up this procedure considerably. FPM, for example, has a low gas permeability for air. A final pressure of approx. 10^{-7}mbar is reached in typical cases. The possible final pressure that can be reached is determined by the number of elastomers used. Elastomer seals can be used several times due to their elastic deformation. They require a contact force of a new N/mm^2. Under the following conditions, elastomer seals can age relatively quickly: UV radiation, oxygen, ozone, heat, cold, high temperature variation, moisture, solvents or mechanical loads.

Storage conditions of elastomer seals:
To ensure that their properties are retained as long as possible, we recommend the following ambient conditions during storage:

- little temperature variation
- where possible, temperatures between 10 °C and 25 °C
- storage in light-proof containers
- atmosphere free of chemicals
- air humidity bet. 60% and 70%

Metal seals made of aluminium are suitable for assembly on high-grade steel flanges and can be used in a temperature range from –196 °C to 150 °C. They can only be used once. For assembly, special clamping elements for metal seals that generate significantly higher contact forces can be used.

Metal seals made of copper are suitable for assembly on high-grade steel flanges and can be used in a temperature range from –196 °C to 200 °C. A silver coating increases the maximum temperature to 450 °C. They can only be used once. They are suitable for a pressure range of 1 bar to 10^{-13}mbar. For assembly, special clamping elements for metal seals that generate significantly higher contact forces must be used.

Properties of elastomer seals

Chemical designation	Abbreviation	Trade name	Temperature application range	Properties and application range
Nitrile rubber	NBR	Perbunan® Buna N®	–30 to +110	Increased media resistance to: hydraulics, pneumatics, petroleum, silicone oils and greases, water up to 80 °C and air. Good helium-proofness final pressures up to $1x100^{-6}$mbar
Fluorocarbon rubber	FKM / FPM	Viton®	–20 to +200	Increased media resistance to: mineral oils and grease, aliphatic, aromatic and chlorinated hydrocarbons, petroleum, diesel, acids, alkaline solutions and silicone oils Suitable for high vacuum $1x10^{-7}$mbar Age resistant, good mechanical properties
Ethylene propylene diene monomer rubber	EPDM	Dutral®	–60 to +150	Increased media resistance to: hot water, steam, alcohols, org. and inorganic acids and alkalis, high cold resistance, ageing resistance and ozone resistance, non-mineral oil resistant, final pressures up to $1x10^{-6}$mbar novotek standard • EPDM with peroxide crosslinking • Advantage: high temperature resistance • More durable • No discolouration after contact with metals and other different materials
Chlorobutadiene rubber	CR	Neoprene®	–40 to +110	Increased media resistance to: ammonia, carbon dioxide, silicone oils, remaining properties comparable to NBR final pressures up to $1x10^{-6}$mbar
Silicone rubber	VMQ	Silicone	–60 to +200	Increased media resistance to: hot air, oxygen, inert gases, ozone and UV radiation. Only suitable for static applications! Final pressures up to $1x10^{-5}$mbar
Perfluor rubber	FFKM	Kalrez® Perlast®	–20 to +330	Very high temperature and chemical resistance. FFKM is mainly used in areas where safety standards are extremely high. It unites the chemical properties of PTFE and the mechanical properties of Viton. Final pressures up to $1x10^{-7}$mbar

KF flange components

KF flange components and connecting elements

Description:

KF connections are used in vacuum systems that work with low, medium and high vacuum. These components are manufactured at novotek in accordance with DIN 28403 and ISO 2861 in sizes NW10 to NW50 and are compatible with components from other well-known manufacturers.

All welded parts have been leak-tested using helium and are leak-proof up to 10^{-9}mbarl/s.

The KF connection consists of two symmetrical flanges with a centring ring with O-ring seal and a clamping ring (Fig. 1). The necessary contact pressure for the seal is generated via the conical tightening surfaces at the KF flange and clamping ring. Instead of a clamping ring, collar half shells can also be used.

For the assembly of KF connections on base plates, claws (Fig. 2) are used.

KF connections are suitable for a pressure of 2.5 bar (1.5 bar excess pressure) and pressure of up to 10^{-9}mbar. At a max. pressure of up to 4 bar (3 bar excess pressure), an outer retaining ring in conjunction with a solid clamping ring must be installed.

Please refer to the Materials chapter for operation temperatures, sealing materials and clamping elements.

Design information:

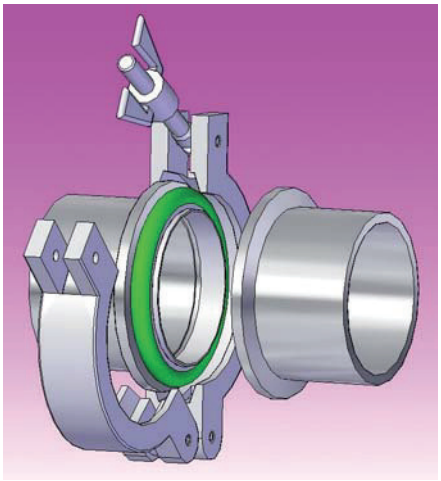

Fig. 1

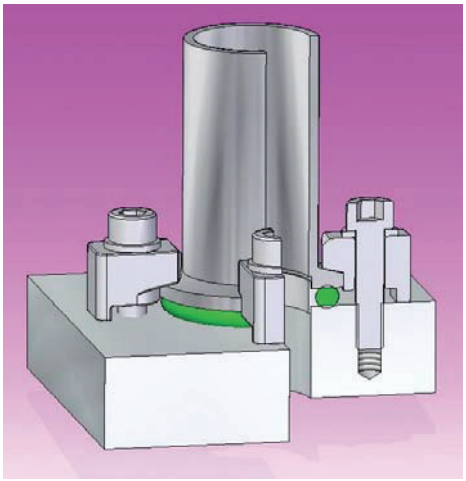

Fig. 2

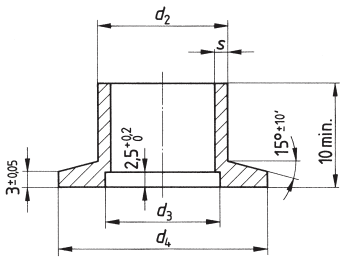
The KF connections and their components are suitable for vacuum-tight connections. Mechanical loads can only be absorbed to a limited extent. Additional mounts are often necessary if other forces are added to the static or dynamic loads of the vacuum system.

KF flange with flanged socket



Main dimensions in accordance with DIN 28403

Nominal width DN	d_2 [mm]	d_3 [mm]	d_4 [mm]	s [mm]

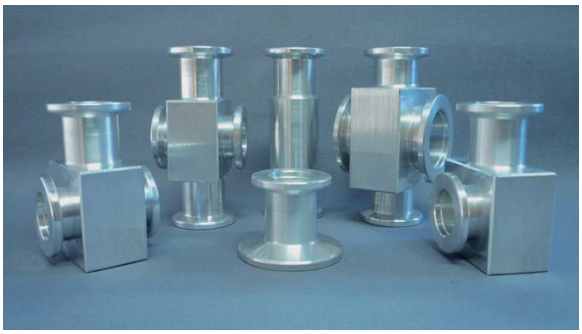
KF junctions



Properties, aluminium 3.1645:
- high leak rate (<10^{-7}mbarl/s)
- high conductance
- low level of outgassing
- compact structure

Description:
The novotek KF junctions made of aluminium are made of solid material. The criteria for selection of the special aluminum alloy are low vapour pressure, high corrosion resistance and a high level of hardness. The elaborate manufacturing process of these KF components made of solid material has been selected to avoid the porosity associated with cast aluminium. The high level of hardness of this aluminum alloy compared to conventional cast aluminium reduces the risk of damage to the sensitive surfaces prepared with precision. The special novotek forming with high variation in the length of legs permits either a space-saving or – if necessary – a stretched out structure. The dimensional arrangement of the junctions allows easy installation of the clamping rings.

Area of application:
The novotek junctions made of aluminium allow the installation of vacuum attachments for the pressure range of 2500 mbar up to 10^{-7}mbar.

Properties of high-grade steel 1.4301 /1.4404:
- high leak rate (<10^{-9}mbarl/s)
- high conductance
- gap-free welded
- can be baked out up to 300 °C/350 °C

Description:
The KF junctions made of high-grade steel are either turned parts or welded constructions with interior welded novotek welding flanges.

Area of application:
The novotek junctions made of high-grade steel allow the installation of vacuum attachments for the pressure range of 2500 mbar up to 10^{-9}mbar. They are mainly used in high-vacuum technology if a bake-out capacity or special corrosion resistance is required.

Properties of polyoxymethylene (POM):

- electr. dielectric strength 25KV/mm
- light weight
- bake-out capacity up to 70°

Description:

The novotek KF junctions made of polyoxymethylene are manufactured using turning and milling technology. The special novotek forming with high variation in the length of legs permits either a space-saving or – if necessary – a stretched out structure. The dimensional arrangement of the junctions allows easy installation of the clamping rings.

Area of application:

The novotek junctions made of polyoxymethylene allow the installation of vacuum attachments for the pressure range of 2500 mbar up to 10^{-5}mbar. Polyoxymethylene is characterised by its high strength, hardness and stiffness in a wide temperature range. It retains its high toughness up to –40 °C, has a high abrasion resistance, a low friction coefficient, high thermoforming stability, good electrical and dielectric properties and low water absorption. Due to the high crystallinity, the natural colour is opal white but the material can be dyed in all muted colours. Delivery state at novotek is opal white.

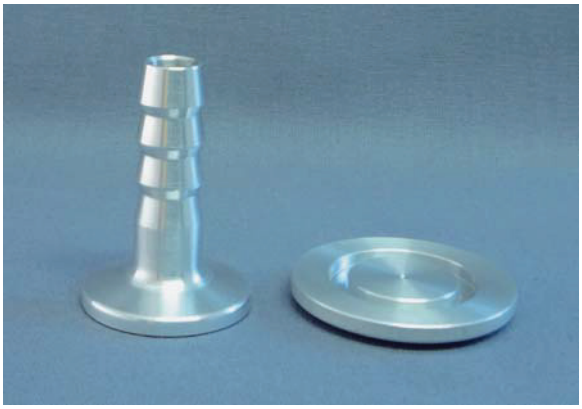
KF components



Properties, aluminium 3.1645:

- high leak rate (<10^{-7} mbarl/s)
- high conductance
- low level of outgassing
- compact structure

Description:

The novotek aluminium components are made of solid material. The criteria for selection of the special aluminum alloy are low vapour pressure, high corrosion resistance and a high level of hardness. The elaborate manufacturing process of these KF components made of solid material has been selected to avoid the porosity associated with cast aluminium. The high level of hardness of this aluminum alloy compared to conventional cast aluminium reduces the risk of damage to the sensitive surfaces prepared with precision.

Area of application:

The novotek components made of aluminium allow the installation of vacuum attachments for the pressure range of 2500 mbar up to 10^{-7}mbar.

Properties of high-grade steel 1.4301 /1.4404:

- high leak rate (<10^{-9}mbarl/s)
- high conductance
- gap-free welded
- can be baked out up to 300 °C/350 °C

Description:

The novotek KF components are designed in accordance with DIN 28403. This ensures compatibility of all components with one another. The components blind flange and KF with hose nozzle are designed with a nominal width combination, i.e. they can be used for two nominal widths.

Area of application:

The novotek components made of high-grade steel allow the installation of vacuum attachments for the pressure range of 2500 mbar up to 10^{-9}mbar. They are mainly used in high-vacuum technology if a bake-out capacity or special corrosion resistance is required.

Properties of polyoxymethylene (POM):

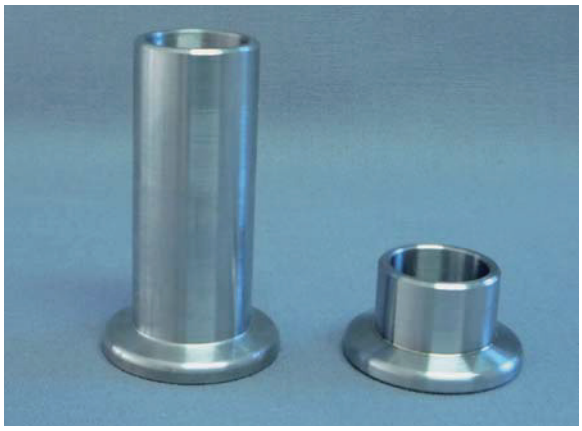
- resistant to diluted alkaline solutions
- electr. dielectric strength. 25KV/mm
- light weight
- bake-out capacity up to 70°

Description:

The novotek components made of polyoxymethylene are prepared with turning technology. The dimensional arrangement of the junctions allows easy installation of the clamping rings.

Area of application:

The novotek components made of polyoxymethylene allow the installation of vacuum attachments for the pressure range of 2500 mbar up to 10^{-5}mbar. Polyoxymethylene is characterised by its high strength, hardness and stiffness in a wide temperature range. It retains its high toughness up to –40 °C, has a high abrasion resistance, a low friction coefficient, high thermoforming stability, good electrical and dielectric properties and low water absorption. Due to the high crystallinity, the natural colour is opal white but the material can be dyed in all muted colours. Delivery state at novotek is opal white.



Properties of steel (1.0037 / 1.0577):

- high leak rate (<10^{-9}mbarl/s)
- high conductance
- bake-out capacity up to 300 °C

Description:

The KF components are manufactured from steels of grade 1.0036-38 (St37-2) 1.0570 or 1.0577 (St52-3). They can be welded very easily and can be stress-relieved. Furthermore, they are highly suitable for nickel or zinc coating.

Area of application:

The novotek components made of steel allow the installation of vacuum attachments for the pressure range of 2500 mbar up to 10^{-9}mbar. They are mainly used in vacuum technology if special corrosion resistance is not required.

Properties of brass 2.0401 / MS58):

- high leak rate (<10^{-9}mbarl/s)
- high conductance
- bake-out capacity up to 110 °C

Description:

The KF components are manufactured from turned brass of grade 2.0401. They are very easily soldered. Furthermore, they are highly suitable for nickel plating.

Area of application:

The novotek components made of brass allow the installation of vacuum attachments for the pressure range of 2500 mbar up to 10^{-9}mbar. The nickel-plated variant is often used in high-vacuum technology as a more cost-effective alternative to high-grade steel. However, the corrosion resistance is still high.

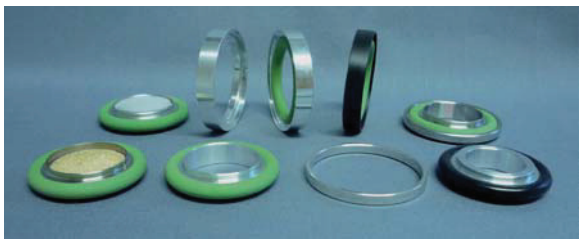
KF seal components



Properties:

- temperature range –196 °C to +200 °C
- suitable for high vacuum up to 1x10^{-9}mbar
- combinable depending on application area

Description:

novotek seal components can be selected depending on the technical vacuum requirements, e.g. bake-out capacity, outgassing and corrosion resistance. The O-ring seals used differ with regard to their temperature stability and compatibility with different media. A series of combination options are described under “Materials” at the beginning of our catalogue.

If there are special requirements, e.g. no permeation of gases or long-term high temperature requirements, aluminium sealing rings are used.

Area of application:

The novotek seal components permit the installation of vacuum attachments for the pressure range from 2500 mbar to 10^{-7}mbar for elastomer seals and up to 10^{-9} mbar for metal seals.

Centring ring, aluminium (3.1645)

Clamping rings, tension chains and claws

Properties:

- temperature range –196 °C to +300 °C
- suitable for high vacuum up to 1x10^{-9}mbar
- simple assembly and disassembly
- maximum pressure 4 bar

Description:

novotek offers five variants of clamping components, whereby specific installation conditions have to be met for each type. The most frequently used clamping component for elastomer seals is the KF clamping ring, consisting of two die-cast aluminium shells and special individual parts made of galvanised steel. A large wing screw is used to achieve the necessary contact force.
If certain installation conditions are met, e.g. small design size, the tension band-clamping ring can be inserted. With KF connections with metal seals, higher and more stable contact pressures much be generated. For this application case, the clamping ring “FL-Massiv” or the tension chain for metal seals must be used.
novotek aluminium claws are required in order to firmly screw flanges onto a component with tapped holes.

Area of application:

The novotek seal components allow the installation of vacuum attachments for the pressure range of 2500 mbar (4000 mbar in conjunction with an outer retaining ring and a solid tension clip) to 10^{-9}mbar.

Clamping ring, aluminium (3.2982)

(suitable for elastomer seals)

> Pressure range: 10^{-7}mbar to 2.5 bar

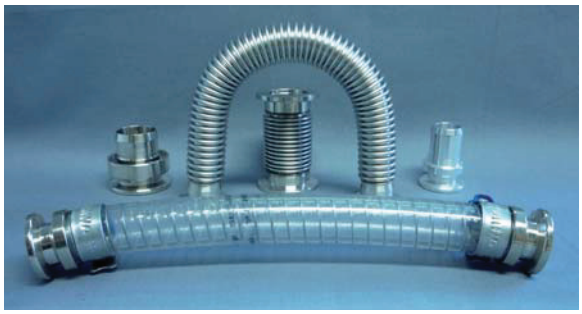
Metal and PVC hoses, metal spring bellows



Properties:

- temperature range –196 °C to +350 °C
- suitable for high vacuum up to 1x10^{-9}mbar
- metal hose lengths of 5 m and longer are possible

Description:

The novotek metal hoses are circular corrugated all-metal hoses. The profiling on the corrugation determines the elastic pliability and compressive resistance. The typical KF connections are welded onto the metal hoses. To eliminate temper colours and clean the weld seam, in a special vacuum annealing procedure the hoses are baked-out at approx. 1040 °C under forming gas. In this process, the metal hose is simultaneously soft-annealed and thus receives its extremely flexibility property.

The novotek metal spring bellows are corrugated metal bellows. The corrugated sections that run concentrically and parallel to one another give the metal spring bellows axial, angular and lateral mobility, whereby combinations of this are also possible. Metal spring bellows are not annealed.

Area of application:

The novotek metal hose connections and metal spring bellows can be used as a mobile vacuum line. If they are used, ensure that the metal hoses can only execute bending movements in a lateral direction. Dynamic axial movements, i.e. buckling or pulling apart both in axial direction as well as torsional movements can only be executed by metal spring bellows.

High-grade steel hose, extremely flexible with KF 1.4301

(Flange 1.4301 / Bellows 1.4404)

> Extremely flexible thanks to soft annealing
> Pressure range: 10^{-9}mbar
> Temperature range: –196 °C to 300 °C*

* Take sealing materials and connecting elements into consideration

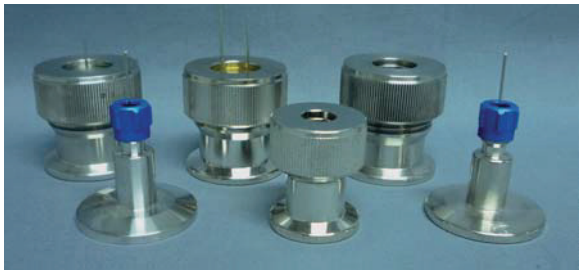
KF feedthroughs



Properties:

- temperature range –20 °C to +180 °C
- suitable for high vacuum up to 1x10^{-9}mbar
- complete sealing via Viton O-rings
- simple structure

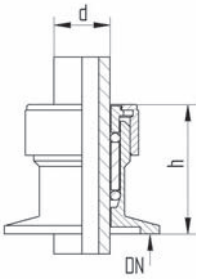
Description:

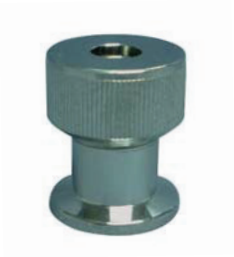
By pressing the O-rings together over the knurled nut or hex nut on the universal thermocouple feedthroughs, we seal off these components between the component and housing.

Area of application:

The novotek KF feedthroughs are used everywhere where cylindrical components with a corresponding surface quality have to be led through vacuum-tight.

KF compression fitting





(High-grade steel 1.4301)

KF adapter

Properties:

- temperature range –196 °C to +350 °C
- suitable for high vacuum up to 1x10^{-9}mbar

Description:

The novotek KF adapters serves as transitions from the KF to various other vacuum-compatible systems.

Area of application:

The novotek KF adapters allow the installation of vacuum attachments for the pressure range of 2500 mbar up to 10^{-9}mbar.

Metric adapter for KF double compression fitting

> Pressure range: 10^{-9} mbar to 2.5 bar
> Temperature range.4301: –196 °C to 300 °C
> Temperature range 1.4404: –196 °C to 350 °C
* Take sealing materials and connecting elements into consideration

ISO-K clamping flange components

ISO-K clamping flange components and connecting elements

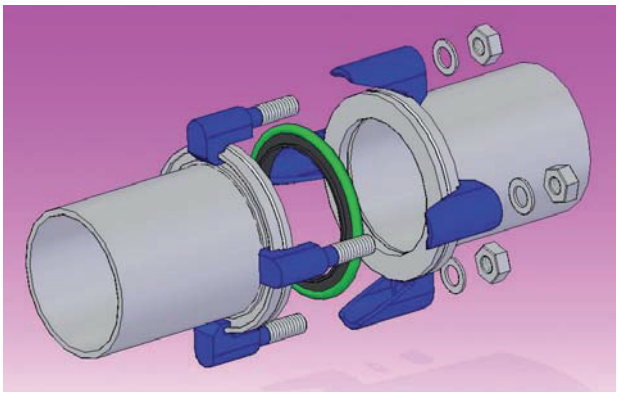
In accordance with DIN 28404 and ISO 1609

Description:

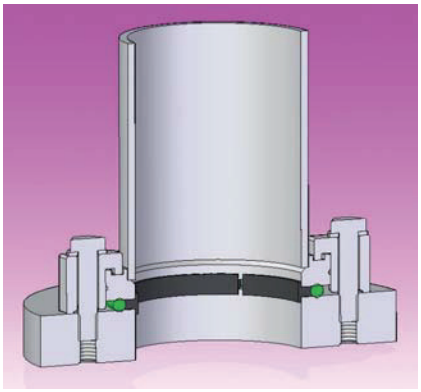
novotek clamping flange components are manufactured in accordance with DIN 28404 and ISO 1609. All components manufactured by novotek are 100% leak-tested and have leak rates better than 10^{-9}mbarl/s. Standard sizes are NW 63 to 320. Nominal widths of up to 630 can be manufactured upon request. ISO-K clamping flange connections are suitable for establishing high-vacuum connection from 10^{-9}mbar to 1.5 bar. Assembly is via screw clamps, claws or a collar flange with snap ring and screws. The clamps, claws or screws must be tightened such that the flanges butt against the centring ring. This requires a considerable increase in torque. Sealing takes place according to the respective requirements via elastomer seals or an aluminium sealing ring. In the case of metal seals, the increased contact forces mean that correspondingly more screw clamps are required (see following table). A collar flange provides a problem-free transition to ISO-F. The transition to KF connections and also CF connections is easily possible using ISO-K/KF or ISO-K/CF adapter pieces.

Please refer to the Materials chapter for operation temperatures, sealing materials and information on the different metals.

Installation variants:



ISO-K flange connection “with screw clamps”



ISO-K flange connection “with claws”

Design features and main dimensions of ISO-K components

ISO-K junctions

Properties of high-grade steel 1.4301 /1.4404:

- high leak rate (<10^{-9}mbarl/s)
- high conductance
- gap-free welded
- can be baked out up to 300 °C/350 °C

Description:

The novotek ISO-K junctions made of high-grade steel are designed as welded constructions. The welds are made on the inside, which guarantees an absolutely gap-free finish. The flanges that guarantee compatibility are manufactured in accordance with DIN 28404 Form B. This makes a trouble-free connection of all components possible. For the flange dimensions, please refer to the design features at the start of this chapter.

Area of application:

The novotek junctions made of high-grade steel allow the installation of vacuum attachments for the pressure range of 1.5 mbar up to 10^{-9}mbar. They can be used in low, medium and high vacuum technology. The components have a bake-out capacity, are corrosion-resistant and their installation location is as desired.

ISO-K crosspiece

> Pressure range: 10^{-7}mbar to 1.5 bar with elastomer seals
> Pressure range: 10^{-9}mbar to 1.5 bar with metal seals
> Temperature range 1.4301: –196 °C to 300 °C
> Temperature range 1.4404: –196 °C to 350 °C
> Clean metallic surfaces on inside and outside.
Polished or glass bead blasted upon request.

* Take sealing materials and connecting elements into consideration

ISO-K components

Properties of high-grade steel 1.4301 /1.4404:

- high leak rate (<10^{-9}mbarl/s)
- high conductance
- gap-free welded
- can be baked out up to 300 °C/350 °C

Description:

Apart from the ISO-K flanges with a long flanged socket all novotek components in the high-grade steel area are turned from solid material or steel tubing. This guarantees maximum precision and an absolute gap-free finish. The flanges that guarantee compatibility are manufactured in accordance with DIN 28404 Form B. This makes a trouble-free connection of all components possible. For the flange dimensions, please refer to the design features at the start of this chapter.

Area of application:

The novotek clamping flange components made of high-grade steel allow the installation of vacuum attachments for the pressure range of 1500 mbar up to 10^{-9}mbar. For aluminium attachments, the pressure range from 1500 mbar to 10^{-7}mbar can be set up. They can be used in low, medium and high vacuum technology. The components have a bake-out capacity, are corrosion-resistant and their installation location is as desired. Compatibility with pipe system in accordance with DIN 11850 is guaranteed.

Blind flange ISO-K

> Pressure range: 10^{-7}mbar to 1.5 bar with elastomer seals
> Pressure range: 10^{-9}mbar to 1.5 bar with metal seals
> Temperature range: –196 °C to 300 °C (1.4301)
> Temperature range: –196 °C to 350 °C (1.4404)
* Take sealing materials and connecting elements into consideration

ISO-K hoses and metal spring bellows

Properties of high-grade steel 1.4301 / 1.4404:

- temperature range –196 °C to +350 °C
- suitable for high vacuum up to $1x10^{-9}$mbar
- metal hose lengths of up to 5 m are possible

Description:

The novotek metal hoses are circular corrugated all-metal hoses. The profiling on the corrugation determines the elastic pliability and compressive resistance. The typical clip flange connections are welded onto the metal hoses. To eliminate temper colours and clean the weld seam, in a special vacuum annealing procedure the hoses are baked-out at approx. 1040 °C under forming gas. In this process, the metal hose is simultaneously soft-annealed and thus receives its extremely flexibility property. The flexibility makes smaller bending radii possible.

The novotek metal spring bellows are corrugated metal bellows. The corrugated sections that run concentrically and parallel to one another give the metal spring bellows axial, angular and lateral mobility, whereby combinations of this are also possible. Metal spring bellows are not annealed.

Area of application:

The novotek metal hose connections and metal spring bellows can be used as a mobile vacuum line. If they are used, ensure that the metal hoses can only execute bending movements in a lateral direction. Dynamic axial movements, i.e. buckling or pulling apart both in axial direction as well as torsional movement can only be executed by metal spring bellows.

Important note:

During evacuation of metal hoses as well as metal spring bellows, the air pressure applied from the outside results in a considerable force acting on the flanges, which causes compression. Only the spring power of the hose and bellows counteracts this. It may be necessary to compensate for the forces that develop.

ISO-K corrugated hose with flange, annealed

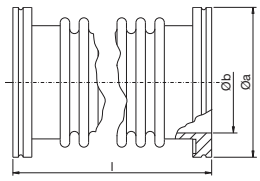
Special length ISO-K corrugated hose, annealed with ISO-K flange

> Available in lengths of 100 mm to 5000 mm
> When ordering, specify desired length additionally in text form
> Pressure range: 10^{-9}mbar
> Temperature range: –196 °C to 300 °C(1.4301)/350 °C(1.4404)*
* Take sealing materials and connecting elements into consideration

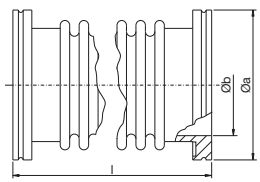


Price example:

High-grade steel hose, extremely flexible 1.4301 NW100 l = 2700 mm contains:	Article no.
High-grade steel hose, extremely flexible 1.4301 ISO-K NW100 l = 1000 mm	6922
High-grade steel hose, extremely flexible ISO-K NW100 sold by the metre 1.7 m	6972x1.7
High-grade steel hose, extremely flexible 1.4301 ISO-K NW100 l = 2700 mm	**6922x2.7**

Special length ISO-K corrugated hose, unannealed with ISO-K flange

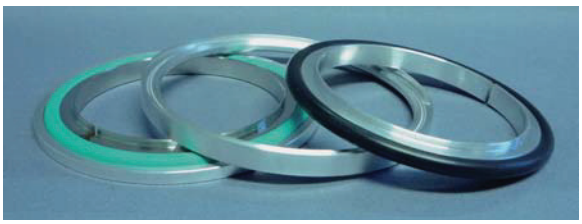
> Available in lengths of 100 mm to 5000 mm
> When ordering, specify desired length additionally in text form
> Pressure range: 10^{-9}mbar
> Temperature range: –196 °C to 300 °C(1.4301)/350 °C(1.4404)*
* Take sealing materials and connecting elements into consideration



Price example:

High-grade steel hose, flexible 1.4301 NW100 l = 2700 mm contains:	Article no.
High-grade steel hose, flexible 1.4301 ISO-K NW100 l = 1000 mm	6922U
High-grade steel hose, flexible ISO-K NW100 sold by the metre 1.7 m	6972Ux1.7
High-grade steel hose, flexible 1.4301 ISO-K NW100 l = 2700 mm	**6922Ux2.7**

ISO-K seal components



Properties:

- temperature range –60 °C to +200 °C
- suitable for high vacuum up to 1x10^{-7} mbar
- combinable depending on application area

Description:

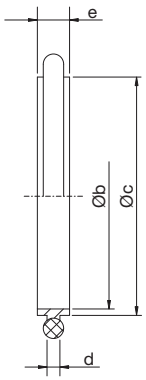
novotek seal components can be selected depending on the technical vacuum requirements, e.g. bake-out capacity, outgassing and corrosion resistance. The O-ring seals used differ with regard to their temperature stability and compatibility with different media. A series of combination options are described under “Materials” at the beginning of our catalogue.

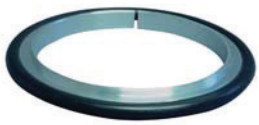
If there are special requirements, e.g. no permeation of gases or long-term high temperature requirements, aluminium sealing rings are used.

Area of application:

The novotek seal components allow the installation of vacuum attachments for the pressure range of 1500 mbar up to 10^{-7}mbar.

ISO-K centring ring, aluminium, without outer ring





> Pressure range: 10^{-7} mbar to 2.5 bar
> Temperature range for aluminium: –196 °C to 150 °C*
> Temperature range for NBR: –30 °C to 110 °C
> Temperature range for FKM/FPM: –20 °C to 200 °C
> Temperature range for EPDM: –60 °C to 150 °C
> Temperature range for CR: –40 °C to 110 °C
> Temperature range for VMQ: –60 °C to 200 °C

ISO-K connecting components and accessories

Properties:

- temperature range –196 °C to +300 °C
- suitable for high vacuum up to 1x10^{-9}mbar
- simple assembly and disassembly
- maximum pressure 1.5 bar

Description:

novotek offers various version of connecting elements in nominal widths DN63 to DN500. They are all compatible with high-vacuum components in accordance with DIN 28404.

Area of application:

The novotek connecting components allow the installation of vacuum attachments for the pressure range of 1500 mbar up to 10^{-9} mbar.

ISO-K screw clamp

> Pressure range: 10^{-9} mbar to 1.5 bar*
> Temperature range: high-grade steel –196 °C to 300 °C*, steel, galvanized, 0°C to 150 °C
> High-grade steel screw clamps should only be used with thread lubricant.
> Suitable for elastomer seals and metal seals

* Take sealing materials and connecting elements into consideration

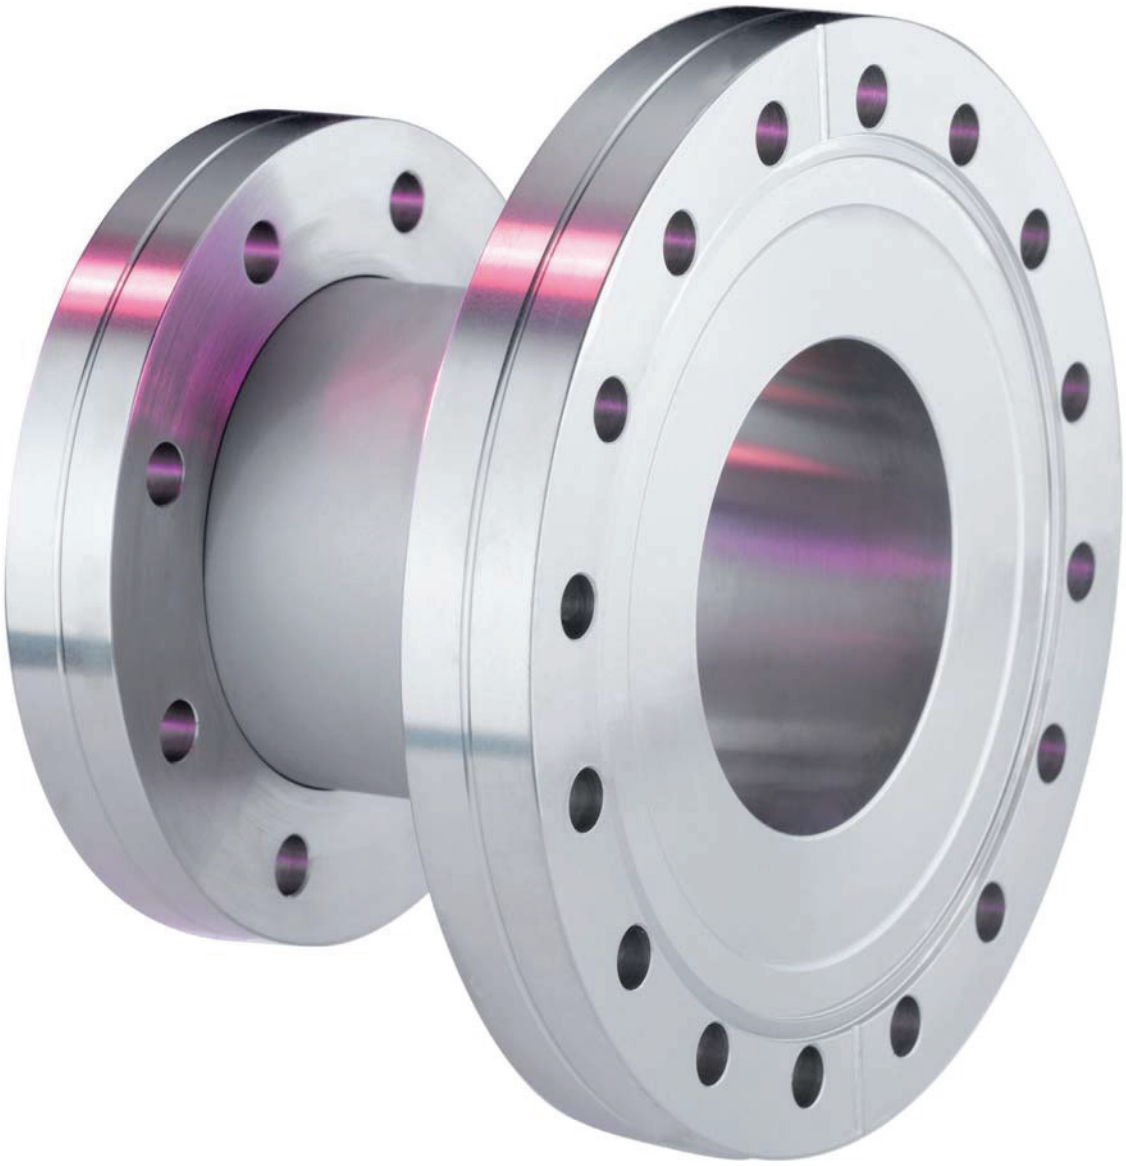
CF components and connections



CF flange components and connecting elements As per ISO 3669 (corresponds to ConFlat® flange)

Description:

novotek CF components are manufactured according to ISO 3669. All components manufactured by novotek are 100% leak-tested and have leak rates better than 10^{-10} mbarl/s. Standard sizes are NW 16 to 250. Nominal widths of up to 400 can be manufactured upon request. The ultra high vacuum range (UHV) designates the pressure range $<10^{-8}$mbar. To reach and maintain this low pressure range, a very low outgassing rate is required in the vacuum system. This is achieved by using material with as low a desorption, diffusion and permeation rate as possible and by preventing unventilated cavities and gaps and by using vacuum-compatible cleaning systems. Please refer to the Materials chapter for operation temperatures, sealing materials and information on the different metals.

Sealing principle:

The CF connection is sealed off by the cutting edge profile in the flange and a copper sealing washer. The copper sealing washer is inserted in the flange groove and, at the same time, centres the flange pair. When bolting the flanges, the cutting edges of the flanges for sealing are pressed deeply into the soft sealing washer, whereby the metal “flows away” radially and is pressed on the outside against the flange groove and limited. Even in the case of material creeping, this guarantees leak-tightness.

Design features:

The flanges of the CF components are designed according to ISO 3669. They are compatible with the ConFlat® flanges of other leading manufacturers. Retrofitting in novotek CF systems or systems from other manufacturers is possible. The standard material used is low-carbon high-grade steel with material number 1.4306 (304L). For the most common flanges and components, higher quality high-grade steels 1.4404 (316L) can also be used. The material number for the component can be found in the respective catalogue sections. Due to the bake-out capacity required in UHV technology, sealing of the CF flanges is by means of a flat seal made of oxygen-free (OFHC) copper. The contact pressure is generated by diametrical tightening of the screws. The copper seal can only be used once. When baking out CF connections, ensure that heating up and cooling is carried out uniformly and relatively slowly.

Installation variant, CF flange connection

CF junctions

Properties of high-grade steel 1.4306/1.4404:

- high leak rate (<10^{-10} mbarl/s)
- high conductance
- gap-free welded
- bake-out capacity up to 450 °C
- cleaned in UHV-compatible manner
- special dimensions upon request

Description:

The novotek CF junctions made of high-grade steel are designed as welded constructions. The CF flange are always welded using WIG welding technology gap-free on the inside and vacuum-tight. The surface of NW16 to NW63 is polished on outside and inside, NW100 to NW250 polished on inside, outside matted or glass bead blasted.

Upon special request, the components can also be electropolished prior to delivery.

Area of application:

The novotek CF junctions can be used in systems with pre-, high- and UHV-vacuum.

Materials:

CF welding flanges made of 1.4306 (304L), 1.4404(316L) and pipe components made of 1.4404 (316L) / 1.4571 (316Ti)

Special material such as 1.4429 ESR is available upon request.

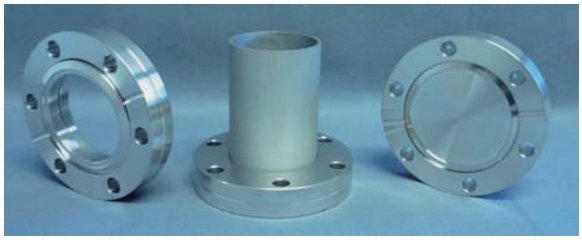
Component with flanges made of 316L or 316LNS upon request.

CF components



Properties of high-grade steel 1.4306/1.4404:

- high leak rate (<10^{-10} mbarl/s)
- high conductance
- gap-free welded
- bake-out capacity up to 450 °C
- cleaned in UHV-compatible manner
- special dimensions upon request

Description:

The novotek CF components are turned from high-grade steel. Particular emphasis is placed on exact profile production during this process. The cutting edge, the decisive element of the CF components, is protected by a flange cap. Any damage to the cutting edge renders the component unusable. On the cutting edge side, the flanges have a radial leak detection groove so that, during the leak test, a check directly at the seal is possible.

Area of application:

The novotek CF junctions can be used in systems with pre-, high- and UHV-vacuum.

Materials:

CF welding flanges made of 1.4306 (304L), 1.4404(316L) and pipe components made of 1.4404 (316L) / 1.4571 (316Ti) Special material such as 1.4429 ESR is available upon request.

CF blind flange, fixed

> Pressure range: 10^{-12} mbar to 1.0 bar
> Temperature range 1.4301: –196 °C to 300 °C

CF adapter

Properties of high-grade steel 1.4306/1.4404:

- high leak rate (<10^{-9}mbarl/s)
- high conductance
- gap-free welded
- cleaned in UHV-compatible manner
- special dimensions upon request

Description:

The novotek CF adapters serve as transitions from the CF flange to a very wide variety of vacuum-compatible systems.

Area of application:

The novotek CF adapters allow the installation of vacuum attachments for the pressure range of 1000 mbar up to 10^{-9} mbar.

CF adapter for double compression fitting, metric

> Pressure range: 10^{-9}mbar to 1.0 bar
> Temperature range 1.4306: –196 °C to 300 °C
> Flanges made of 1.4306 (304L), adapter 1.4404 (316L)
> Other materials and sizes upon request

* Take sealing materials and connecting elements into consideration

CF hoses and metal spring bellows

Properties of high-grade steel 1.4306/1.4404:

- temperature range –196 °C to +350 °C
- suitable for high vacuum up to $1x10^{-9}$mbar
- metal hose lengths of 5 m and longer are possible

Description:
The novotek metal hoses are circular corrugated all-metal hoses. The profiling on the corrugation determines the elastic pliability and compressive resistance. The typical CF flanges are welded onto the metal hoses. To eliminate temper colours and clean the weld seam, in a special vacuum annealing procedure the hoses are baked-out at approx. 1040 °C under forming gas. In this process, the metal hose is simultaneously soft-annealed and thus receives its extremely flexibility property. The flexibility makes complicated line runs with small bending radii possible.

The novotek metal spring bellows are corrugated metal bellows. The corrugated sections that run concentrically and parallel to one another give the metal spring bellows axial, angular and lateral mobility, whereby combinations of this are also possible. Metal spring bellows are not annealed.

Area of application:
The novotek metal hose connections and metal spring bellows can be used as a mobile vacuum line. If they are used, ensure that the metal hoses can only execute bending movements in a lateral direction. Dynamic axial movements, i.e. buckling or pulling apart both in axial direction as well as torsional movement can only be executed by metal spring bellows.

Important comment: During evacuation of metal hoses as well as metal spring bellows, the air pressure applied from the outside results in a considerable force acting on the flanges, which causes compression. Only the spring power of the hose and bellows counteracts this. It may be necessary to compensate for the forces that develop.

CF corrugated hose, extremely flexible, 1 flange, rotatable

> All technical data and properties apply at normal air pressure of 1013 mbar and a temperature of 20 °C
> **Extremely flexible thanks to soft annealing**
> Pressure range: 10^{-9}mbar
> Temperature range 1.4306: –196 °C to 300 °C
> Temperature range 1.4404: –196 °C to 350 °C
> Special lengths upon request
* Take sealing materials and connecting elements into consideration

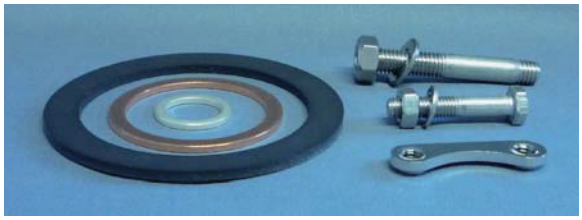
High-grade steel hose with CF flange connection, one side rotatable, extremely flexible CF NW100 l = 2700 mm in 1.4306 (304L)	**7924 x2.7**

CF seal components



Properties:

- metallic joint
- bake-out capacity up to 450 °C
- combinable depending on application area
- use thread lubricant for screw connections
- when baking out, use silver plated seals

Description:

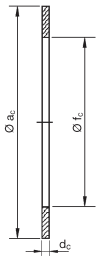
The CF seal components are required to establish a metallic UHV-tight connection. The standard sealing material used is oxygen-free OFHC copper. The Cu sealing washer can only be used once and for temperatures up to 200 °C. To prevent oxidation and for temperatures up to 450 °C, silver-plated copper seals are used. For test purposes and pressures up to $1x10^{-7}$mbar, CF Viton seals, which can be used several times, are often used. The CF connecting components are suitable for establishing up a reliable flange connection. The screws are compiled in various sets corresponding to the usage and handling. To guarantee fast and easy assembly of flanges with smaller nominal widths, DUO nuts are often used.

Important note:

When baking out CF connections and components, ensure that heating up and cooling and is carried out uniformly and slowly. Leaks and stress occur at the flanges due to high temperature differences.

High temperature gradients must be avoided in all circumstances!

CF copper seal made of OFHC copper, unannealed



> Pressure range: 10^{-13} mbar to 1.0 bar
> Temperature range: –196 °C to 200 °C
> Can only be used once

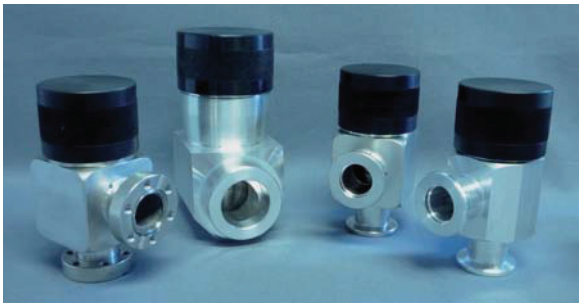
Valves

Corner and full-way valves, manually actuated and electro-pneumatic



Properties

- high leak rate (<10^{-8}mbarl/s)
- single-acting pneumatic unit
- high conductance
- spring bellows and internal components made of high-grade steel
- valve face and housing are FKM-sealed
- reliable function in all installation positions
- long service life and low-maintenance

Description:

The novotek corner and full-way valves made of aluminium and high-grade steel meet special leak-tightness requirements of high-vacuum valves. To achieve this leak-tightness, novotek uses spring bellows seals in conjunction with FKM-sealed connecting components. The valve housing is manufactured from a drawn aluminium profile or from high-grade steel solid material. The connection between valve plate, spring bellows and sealing plate is laser-welded and guarantees high-vacuum sealing at all times.

Pneumatic valves:

The pneumatic unit is single-acting. This means that the valve is de-energized and closed unpressurised. The valve is opened either directly via compressed air or controlled via an optionally integrated pilot valve that forwards the compressed air to the valve. For special applications, which are usually safety-relevant, the valves can also be supplied in the version open when de-energised and depressurised. The position indicator (optional) signals the open or closed position. Valves supplied without position indicator and control valve signal the open and closed position by means of a pin on the valve cover.

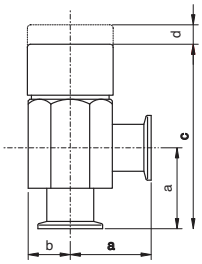
Area of application:

They are used as shut-off valves, vent valves and high-vacuum valves, have a light weight, a small overall height and a high conductivity value. They can be installed as required and fail-safe in compact systems. The electro-pneumatically actuated valves are suitable for an automated vacuum system (usually controlled via PLC).

Materials:

The different materials are compiled as follows:
Aluminium housing 3.1645, high-grade steel housing and high-grade steel internal parts 1.4301 or 1.4305. Metal bellows made of high-grade steel 1.4571 and seals made of FKM/FPM.

Corner valves KF / ISO-K, manually actuated, aluminium (3.1645)



> Bellows sealed 1.4571
> Internal parts made of 1.4301
> Rotary knob aluminium-anodized
* Take sealing materials and connecting elements into consideration

Butterfly valves KF / ISO-K, manually actuated and electro-pneumatic

Properties:

- high leak rate (<10^{-8}mbarl/s)
- single-acting pneumatic unit
- high conductance
- internal parts made of high-grade steel
- FKM O-ring sealed
- optical position display (manual)
- long service life and low-maintenance
- compact design and light weight

Description:

The novotek butterfly valves made of aluminium and high-grade steel meet special leak-tightness requirements of high-vacuum valves. To achieve this leak-tightness, novotek uses O-ring connections with FKM-sealed connecting components. The valve housings are manufactured from aluminium or high-grade steel solid material. Thanks to their compact design, they are also used in areas that are otherwise reserved for gate valves. Closing is carried out by swivelling the viton-sealed valve plate into the housing sealing surface. The T handle, which permits simple actuation even for inaccessible attachments, also serves as an easily visible position display.

Pneumatic valves:

The pneumatic unit is single-acting. Upon request, it can also be supplied with a double-acting swivel drive. This means that the valve is de-energized and depressurised when closed. The valve is opened either directly via compressed air or controlled via a pilot valve that forwards the compressed air to the valve. The position indicator (optional) signals the open or closed position.

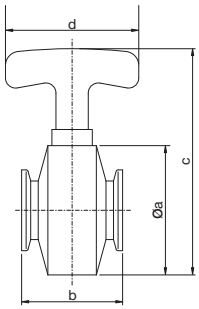
Area of application:

They are used as shut-off valves, vent valves and high-vacuum valves, have a light weight, a small overall height and a high conductivity value. They can be installed as required fail-safe in compact systems. The electro-pneumatically actuated valves are suitable for an automated vacuum system (usually controlled via PLC). They are also often used as a cost-effective alternative to gate valves if an optically free passage is not required.

Materials:

The different materials are compiled as follows: aluminium housing 3.1645, high-grade steel housing and high-grade steel internal parts 1.4301, 1.4404 and seals made of FKM/FPM.

Butterfly valves KF manual, aluminium (3.1645)



> Internal parts made of 1.4301, body made of aluminium 3.1645
> T handle made of plastic
> Can be used in high-vacuum area but not in the pressure range above 1 bar.
> Valve position display via T handle
> Almost completely free passage in open position.

KF ball valve, actuated manually and electro-pneumatically

Properties:

- single-acting pneumatic unit
- high conductance
- PTFE-sealed
- reliable function in all installation positions
- long service life and low-maintenance
- optical position display (with manual actuation)

Description:

The ball valves are shut-off valves with a ball as an active shut-off element, which is surrounded by two PTFE-sealed ball seats. The shifting shaft is sealed off by a Viton- or PTFE-sealed compression gland. The manually actuated ball valves are actuated by rotating the switching handle 180°. At the same time, the switching handle serves as a position display. The three-way ball valve has an L design with a 180° stop. The supply line 1 can be connected either with outlet 2 or 3. During switch-over, all outlets are separated from one another.

Pneumatic valves:

The pneumatic unit is single-acting. Upon request, it can also be supplied with a double-acting swivel drive. This means that the ball valve is de-energized and depressurised when closed. The ball valve is opened either directly via compressed air or controlled via a pilot valve that forwards the compressed air to the ball valve. The position indicator (optional) signals the open or closed position.

Area of application:

The ball valves can be used as shut-off valves with full bore in vacuum and low-pressure systems. They can be used in a pressure range from 10^{-6}mbar to 2.5 bar and can be installed fail-safe as required in compact systems. The electro-pneumatically actuated valves are suitable for automated vacuum systems (usually controlled via PLC).

Materials:

Housing: hot-pressed brass, nickel-plated 2.0401 (MS 58) or high-grade steel 1.4408
Ball: brass 2.0401 (MS 58) hard-chrome plated or high-grade steel 1.4408 / 1.4401
Ball sealer: PTFE
Stem seal: FKM or PTFE

2-way ball valve KF manual

> Handle used for position display open / closed
> Pressure range: 10^{-6}mbar to 2.5 bar
> Free passage in open position
> Sealing material FKM, PTFE
> Brass maintenance-free / high-grade steel 20000 cycles
* Take sealing materials and connecting elements into consideration

KF vent valve

Properties:

- FKM/FPM-sealed
- reliable function in all installation positions
- long service life and low-maintenance
- connection KF NW10

Actuation:

The valve is actuated by tightening or releasing the knurled cap.

Area of application:

Venting of vacuum chambers and receivers

Materials:

Housing: brass, nickel-plated 2.0401 (MS 58) or high-grade steel 1.4301
Seal: FKM

> Actuation of knurled cap
> Temperature range: –30 °C to 110 °C brass
> Temperature range –30 °C to 160 °C high-grade steel
> Sealing material FKM/PTFE
* Take sealing materials and connecting elements into consideration

3-way valve KF, aluminium 3.1645

Properties:

- FKM-sealed
- reliable function in all installation positions
- long service life and low-maintenance
- optical position display (manual)
- freely selectable KF connections
- high leak rate

Description:

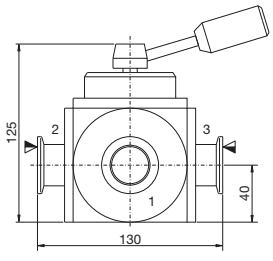
The novotek 3/3-way valves consist of an aluminium housing with three freely available KF connections. The 3/3-way valve has an L-design. The supply line 1 can be connected either with outlet 2 or 3. Outlet 2 cannot be connected with output 3. In neutral position, all connection are separated from one another. The valve position is displayed using the actuation lever.

Area of application:

The 3/3-way valve replaces two corner valves and its usage is therefore cost-saving. It is also suitable as a pre-vacuum bypass valve.

Materials:

Housing: aluminium 3.1645
Internal parts: brass 2.0401 (MS 58) hard-chrome plated
Seals: FKM



> Handle used for position display open / closed
> Sealing material FKM
* Take sealing materials and connecting elements into consideration

Pressure relief valve, spring preloaded KF / ISO-K, high-grade steel 1.4301

The spring-loaded pressure relief valve uses a spring to pull a plunger with an O-ring seal made of Viton against a sealing face. If an overpressure exists vis-à-vis the ambient pressure of the valve, this acts against the spring. The opening pressure can be adjusted via the spring preload. For this purpose, the nut on the plunger is turned in the direction of the spring or in the opposite direction. Note that the transition between vacuum-tight and a clear decrease of pressure is not abrupt. The specified leak rate < 1. 10^{-7}mbar•l/s is based on the case internal vacuum, external atmosphere. If the spring preload is too low, there is a risk of a permanent leakage because the contact force on the sealing ring is too low. In normal cases, the opening and closing pressure are not identical because the O-ring, depending on application conditions, adheres more or less to the sealing face and this additional force has to be applied by the overpressure. The flow rate depends on the pressure differential between the internal and external pressure. Following high flow volumes, which have led to considerable lifting of the plunger, the valve has to be checked and possibly cleaned with alcohol.

> Opens in case of overpressure
> Works in all installation positions
> Sealing material FKM
> The valve is not suitable for safety-critical applications.
> An exhaust gas hose can be connected on the exhaust gas side

* Take sealing materials and connecting elements into consideration

KF overflow valve, high-grade steel 1.4301

The overflow valve works according to the suspended-body principle. If an overpressure exists vis-à-vis the ambient pressure of the valve, it will raise the suspended body. The opening pressure is set according to the size of the suspended body. Note that the transition between vacuum-tight and a clear decrease of pressure is not abrupt. The specified leak rate < 1. 10^{-5} mbar•l/s is based on the case internal vacuum and external atmosphere. If the pressure differential is too low, there is a risk of a permanent leakage because the contact force on the sealing ring is too low. In normal cases, the opening and closing pressure are not identical because the O-ring, depending on application conditions, adheres more or less to the sealing face and this additional force has to be applied by the overpressure.

> Opens in case of overpressure
> Can only be installed vertically **“installation position-dependent”**
> Sealing material FKM
> The valve is not suitable for safety-critical applications.
> An exhaust gas hose can be connected on the exhaust gas side
* Take sealing materials and connecting elements into consideration

Gate valves, manually and electro-pneumatically actuated

Properties

- high conductance
- very good leak rate
- slideway
- FKM-sealed valve seat
- reliable function in all installation positions
- long service life and low-maintenance

Description:

The gate valves marketed by novotek are products from the Swiss company VAT Vakuumventile. The closure mechanism is implemented with the patented VATLOCK system, which guarantees maximum reliability and minimal abrasion. In this case, we offer only a selection of the standard version with aluminium housing and high-grade steel housing. Upon request, we can also supply larger nominal widths as well as other values that are not listed here. The great advantage of gate valves is their relatively low weight and the flat design.

Pneumatic valves:

The pneumatic drive is double-acting. The valve is opened either directly via compressed air or controlled via an optionally integrated pilot valve that forwards the compressed air to the valve. The position indicator (optional) signals the open or closed position.

Area of application:

Gate valves are used when a very high conductance value or an optically free passage is required. The flat design permits further advantageous applications.

Materials:

Aluminium housing 3.3206 and 3.3547, high-grade steel housing 1.4301, mechanical system for aluminium gate valve: 1.4301. 1.4310. 1.4034, high-grade steel gate valve in addition 1.4404, FKM seals.

Mini vacuum gate valve KF, manually actuated, VAT® series 01.2, aluminium

Mini UHV gate valve KF/CF, electro-pneumatic VAT® series 01.0, high-grade steel

> VAT gate valves with VATLOCK system
> Slideway and vulcanised plate seal
> Flanges and bellows 1.4435, plate 1.4301
> Head seal, metal, plate seal FKM
> Valve position visually detectable
> Control valve 24 VDC, 5.4W (with spring reset 9W)
> Position indicator ≤ 50V ≤3A, ≤ 250V ≤5A
> Bake-out temperature, housing 250 °C
> Heating up and cooling speed ≤ 50 °C

* Take sealing materials and connecting elements into consideration

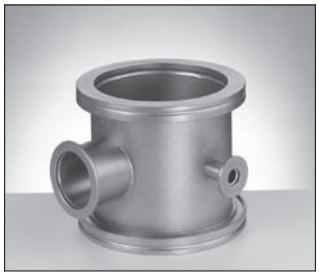
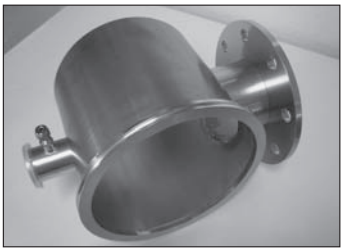
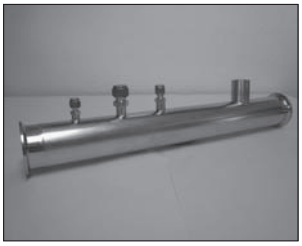
Special components / special products

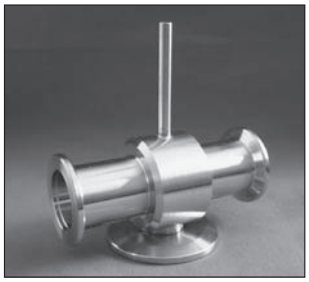
Special components made from standard components

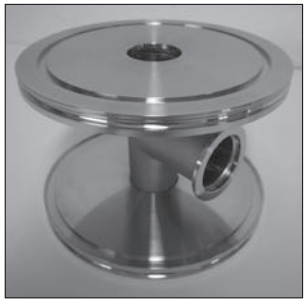
The novotek special component made from KF – ISO-K and CF standard components are produced mainly according to drawings, diagrams or descriptions. In accordance with high-vacuum technology requirements, they are manufactured using WIG manual welding technology, if necessary, using a microscope, laser welding or orbital welding. Our customers decide on the surface characteristics, such as unplated, glass bead blasted, electropolished or vacuum-annealed and on the leak rate requirements. In this case, we are able to produce standard components up to $1x10^{-9}$mbarl/s and special components up to $1x10^{-10}$mbarl/s. Furthermore, we have a very wide range of extremely varied materials and have the option of cleaning the components in a special ultrasonic cleaning procedure suitable for high vacuum.





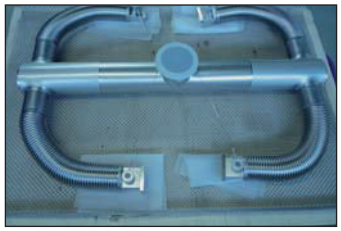


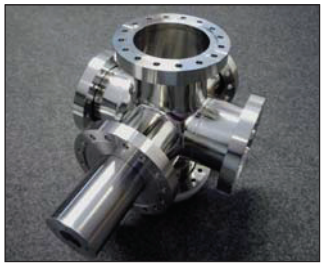




Special components according to customer drawing

A small selection of special components according to customer requirements serves to demonstrate our options for a very wide variety of production processes. Since the start of 2011 we have been using our own CNC-controlled lathe and mill cutters, which allow us to offer the shortest possible delivery times of a few days and hours.





Chambers and receivers for high-vacuum applications

The novotek chambers are used in the partial pressure and high-vacuum areas. They are manufactured from a very wide variety of materials according to customer requirements and are installed in research and industrial plants. Our Production department works to very high quality standards at all times. A final leak test record documents the leak-tightness of our chambers.

Metal hoses, metal bellows and diaphragm bellows as special components

The novotek hoses and bellows are manufactured in different designs. We shall be glad to help you in the design phase of the bellows. The associated bellows request for quotation follows directly.

Underlined features are mandatory for all bellows designs.

Diaphragm bellows data ( ) = standard

Material	❑ AISI 316L	❑ AM 350	❑ Others
Inside diameter	ID mm	❑ exact or	❑ min.
Outside diameter	OD mm	❑ exact or	❑ max.
Operating stroke	axial mm	lateral mm	angular °
or stroke position	from Lc mm With a combined or angular stroke, a diagram is very helpful	to Le mm	frequency Hz
Permissible forces	axial N	lateral N	angular °
Service life	❑ Nz (10'000) cycles	❑ Nz > cycles	
Temperature	Operation °C (20 °C)	Baking out °C (80 °C)	
Operating pressure	inside bar (0)	outside bar (l)	
Installation pos.	❑ any	❑ vertical	❑ horizontal
Max. installation dimensions (length, diameter) if known and/or required		length mm	dia. mm

End pieces

❑ Provided by customer

Please note: connection to bellows in acc. with our seal-weld lip standard
Material for bellows end pieces: 1.4435 ESR or forged.

❑ No end pieces
❑ With end pieces

Standard:
❑ End piece with pipe ❑ End piece from DN 63 without pipe
❑ CF flange ❑ x fixed ❑ x rotating
❑ ISO-KF
❑ ISO-K

Special:
❑ End piece according to drawing
❑ CF flange: ❑ with thread ❑ in 1.4429/316 LN ❑ according to drawing
❑ ISO-F
❑ ISO-KF L = _____ ❑ according to drawing

❑ Align end pieces to one another: ❑ ± 5° (by eye) ❑ ± _____ °

Certificates

❑ Helium Leak Test ❑ Material Certificate for Strip Material ❑ Material Certificate for End Piece Pipe Material
❑ Measurement records (only with drawing)

Inspection glasses and glass elements

Components made of borosilicate

Properties:

- transmission range 0.4 – 2.0 µm
- vacuum-tight > $1x10^{-11}$ mbarl/s
- light weight
- max. temperature 350 °C

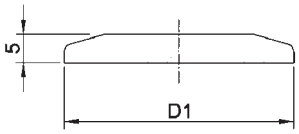
Area of application:

Many technical vacuum applications require that the process room within the vacuum plant is optically observed. Depending on the process, the requirements range from simple visual observation for position tasks to high-precision optical measurements.

Following selection criteria may be helpful:

- Wave length, surface characteristics (scratches, flatness, parallelism, heat treatment, coating, anti-reflection coating), pressure range, radiation level, media characteristics, e.g. aggressive gases, temperature range.

KF glass flange (blind flange)



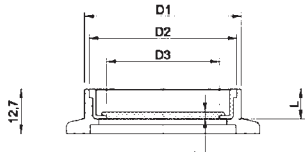
> Pressure range: 10^{-7} mbar to 1.5 bar*
> Temperature range: –15 °C to 150 °C*
> Chemically resistant
> Low thermal expansion and temperature-resistant
> Heating up and cooling with max. 300 °C/hour
> Standard inspection glass for visible area
> Limited transmission in UV range (0.4 µm – 2.0 µm)

* Take sealing materials and connecting elements into consideration

Borosilicate

Nominal width DN	D1	Article no.
16	30	2112
25	40	2114
40	55	2116
50	75	2117

KF inspection glass



> Pressure range: 10^{-9} mbar to 1.5 bar*
> Temperature range: –100 °C to 300 °C*
> Chemically resistant
> Low thermal expansion and temperature-resistant
> Heating up and cooling with max. 300 °C/hour
> Standard inspection glass for visible area
> Limited transmission in UV range (0.4 µm – 2.0 µm)
> Flange made of high-grade steel with integrated FPM O-ring

* Take sealing materials and connecting elements into consideration

Borosilicate / high-grade steel 1.4301

Nominal width DN	D1 [mm]	D2 [mm]	D3 [mm]	T [mm]	L [mm]	Article no.

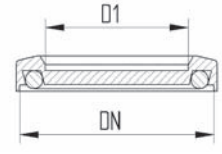
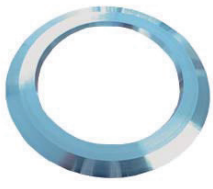
KF inspection glass, aluminium





> Pressure range: 10^{-9} mbar to 3 bar*
> Temperature range: –15 °C to 150 °C*
> Chemically resistant
> Low thermal expansion and temperature-resistant
> Heating up and cooling with max. 300 °C/hour
> Standard inspection glass for visible area
> Limited transmission in UV range (0.4 µm – 2.0 µm)
> Flange made of aluminium with integrated FPM O-ring

* Take sealing materials and connecting elements into consideration

Borosilicate / aluminium (3.2315)

Nominal width DN	D [mm]	D1 [mm]	h [mm]	Article no.
25	40	26	10	2134
40	57	41	10	2136
50	77	52	10	2137

ISO-K inspection glass

> Pressure range: 10^{-9}mbar to 1.5 bar*
> Temperature range: –15 °C to 150 °C*
> Chemically resistant
> Low thermal expansion and temperature-resistant
> Heating up and cooling with max. 300 °C/hour
(from NW200 max. 100 °C/h)
> Standard inspection glass for visible area
> Limited transmission in UV range (0.4 µm – 2.0 µm)
> Flange made of high-grade steel 1.4301 with integrated FPM O-ring
> Assembly without additional seal.
(claw are not suitable)

* Take sealing materials and connecting elements into consideration

Accessories

High-vacuum grease Dow Corning®

> Temperature range: –40 °C to 150 °C*
> Vapour pressure: at 60 °C = 1.3x10^{-7}mbar, at 110 °C = 2x10^{-5}mbar, at 150 °C = 1x10^{-3}mbar
> Colour: transparent
> Good lubrication and sealing behaviour, tends to creep
> Not suitable for coating plants because even an extremely small amount of grease is sufficient to prevent paint from adhering.

	Article no.
High vacuum grease 50g	7009

Thread lubricant Molykote®

> Suitable for high-grade steel screw connections, in particular, with heated flanges
> Prevents seizing of screws during release and when creating a screw connection
> Very favourable friction coefficient
> Operation temperature –30 °C to 650 °C

	Article no.
Thread lubricant for screw sets 100g	7010

Stock list, pipes

> Pressure range: 10^{-9}mbar to 2.5 bar
> Temperature range 1.4301: –196 °C to 300 °C*
> Surface unplated
> Price quotation per metre, maximum length 6 m
> Tolerances according to EN ISO 1127 for high-grade steel
